

# Using the Steam **Retro Arch** emulator with the Amiga game **Settle the World** and additionally setting up a multiplayer game via **Steam Remote Play**

- Add the free **Retro Arch** emulator to your Steam library
- Launch the **Retro Arch** emulator
- Move to the **Settle the World** project page: <https://theotheoderich.itch.io/settle-the-world>
- Download the latest **HDF** (Hard Disk File) development version of the game (e. g. SettleTheWorld.hdf (22.11.2023 Dev Version))
- Save this HDF file on your computer so that you can find it again.

- Select the **Load Core** option from the Main Menu

The selection of the corresponding emulator core only needs to be made once.

- Select the **Commodore – Amiga (PUAE)** core and go back to the Main Menu.

## Load Core

22-11 11:21 ⌚

Atari - 5200 (a5200)

License: GPLv2

Atari - 5200 (Atari800)

License: GPLv2

Atari - Lynx (Handy)

License: Zlib

Bandai - WonderSwan/Color (Beetle Cygne)

License: GPLv2

Commodore - Amiga (PUAE)

License: GPLv2

Enterprise - 64/128 (ep128emu)

License: GPLv2

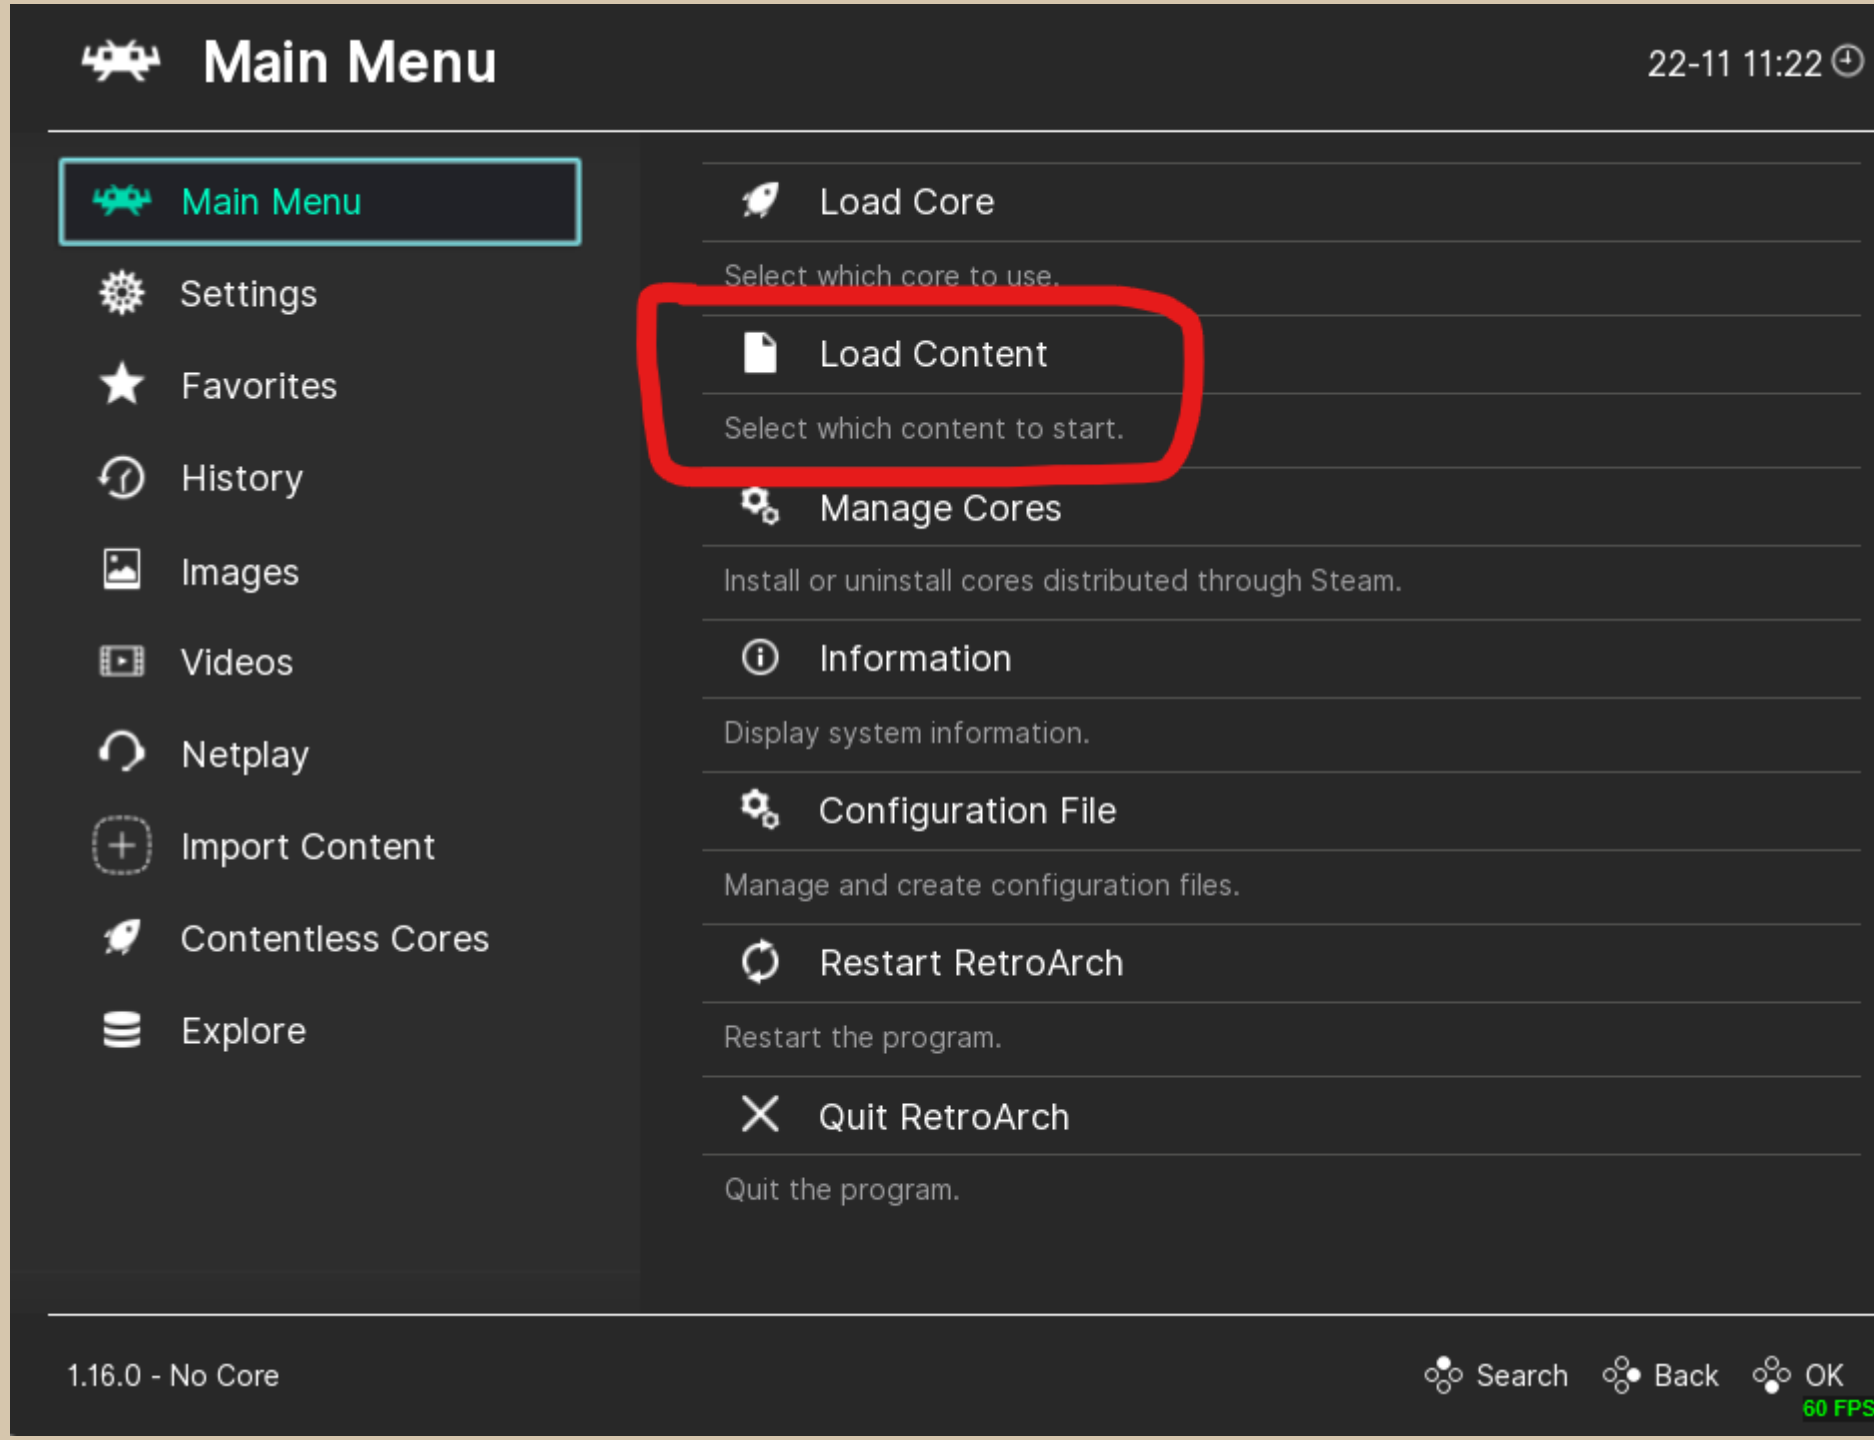

GCE - Vectrex (vecx)

License: GPLv3

Infocom Z-Machine (MojoZork)

- Select **Load Content** from the Main Menu

- Search for the downloaded **Settle the World HDF** file.

- Select this **HDF** file by double-clicking with the left mouse button

- After a short moment the emulated **Amiga** environment should start.

The emulator complains about the missing Kick-ROM (see below left), but still works thanks to the built-in, free **AROS** Kick-ROM.

- A moment later, the **Settle the World** title screen and main menu should appear.
- Now it is important to press the **Game Focus** button so that all button presses are forwarded to the emulation.

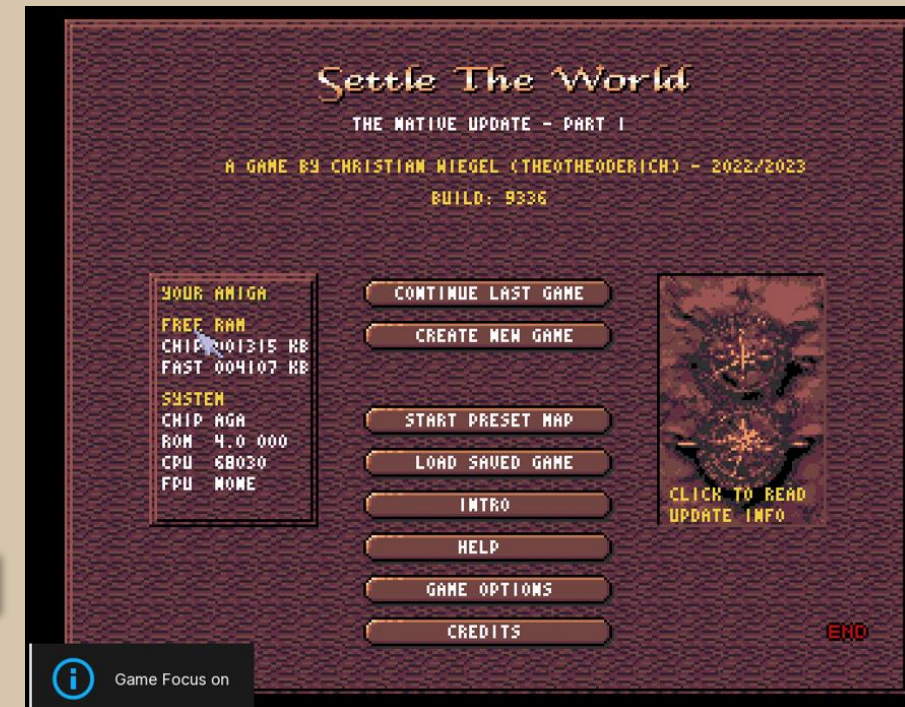

### Game Focus (Toggle)

Key scroll\_lock

Switches 'Game Focus' mode on/off. When content has focus, hotkeys are disabled (full keyboard input is passed to the running core) and mouse is grabbed.

- Pressing this button again switches the game focus off again and allows you to access the emulator settings by pressing **F1**, for example.

- The game can now be played.

I recommend playing one of the pre-made maps (**Preset Maps**) to start with, as calculating a new map with the standard Retro Arch emulator settings can otherwise take a few minutes.

- It is also possible to play the game with **multiple players** via **Steam Remote Play**.

**Settle the World** offers "local" multiplayer with up to four players (hot-seat).

All players look at the same screen and make their moves one after the other.

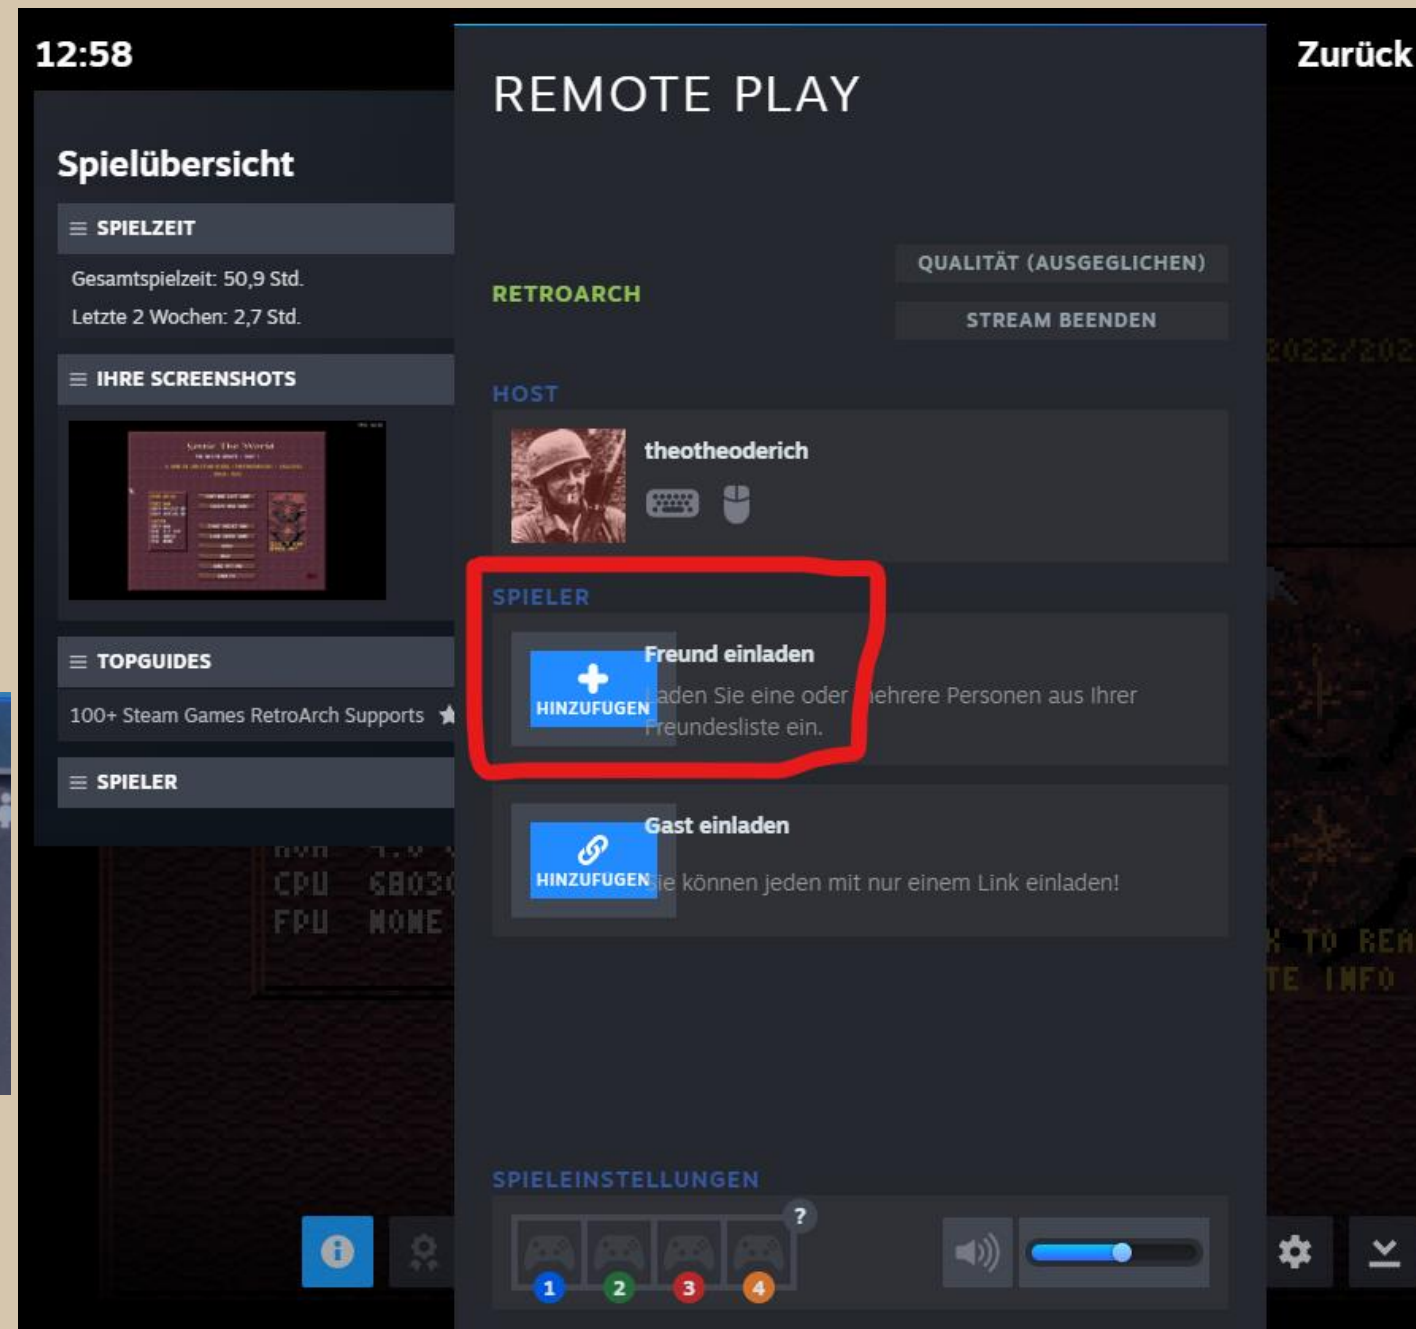

Each player can therefore see everything that his fellow players are doing.

- Make sure that you and your friends are logged in to Steam and online.

- Now press **SHIFT + TAB** to call up the Steam Overlay and to see the **Remote Play** options.
- Select **Invite Friend**  
(I'm using Steam in German language, so I'm not sure what the options are called in English language.)
- Your fellow player will then receive an invitation to play, which they should accept.

- Give your fellow player access to the **mouse** and **keyboard**.  
You and your fellow player then share the mouse and keyboard controls in the game.
- Press **Back to game** in the top right corner

- Back in the game, you can then load a **Preset Map** and set a second (or more) player.

Don't forget to enter a name (confirm with Return) and select a colour.

- Then click on **Start Game** and a short time later the game will start.
- Have a lot of fun!

If you find errors and bugs, or have problems with the game setup, you are welcome to join the

**Settle the World Discord:**
